TESTS AND RESULTS

Part I. Test Conducted:

EN 1335-1:2000/AC:2002 Office furniture – office working chair – Part 1: dimensions –determination of dimensions

Basis of dimensions:

The dimensions in this standard are based on the conflicting requirements of anthropometric measurements, mechanical design, subjective preference and other factors. In general, they should be suitable for people between 1510 mm and 1920 mm in body height. People with body height outside this range may need furniture of different dimensions or a footrest. Due to the variation in population heights in different countries, there will be a variation in the percentage of the office population which the dimensions will accommodate in each country.

General Test Condition:

The following test program was conducted in a laboratory environment maintained at 15°C to 25°C and 50%±5 RH. The sample was individually tested after conditioning in the test environment for at least 24 hours prior to conducting the test.

The complete detailed procedures may be found in the referenced specification and are only summarized herein. Unless otherwise specified, the tests are carried out in the following order on the same sample.

No. of Sample:

1 piece (Sample 1). For more sample information and pictures, please refer to the following page.

Office Working Chair Type: Type	C. For classification of type,	please refer to Annex A.

Annex A: Classification of office work chair type

Type A, B and C are all required to have adjustable seat height and backrest inclination. They may also have any other adjustment features listed in Table A.1.

- **Type A.** In addition to the above, a type A chair is required adjustable seat depth, seat surface inclination, (at least 6°, and a height of backrest supporting point ("S") above the seat surface. The minimum seat height is required to be 400 mm with a minimum adjustment range of 120 mm.
- Type B. A type B chair has specified dimensions which are the same as those specified for a type A chair except that it is required to have a minimum seat height of 420 mm with a minimum adjustment range of 100 mm.
- **Type C.** A type C chair has specified dimensions which are similar to type A and B chairs except that limits to adjustment range and maximum dimensions are not frequently specified. The minimum seat height is 420 mm with a minimum adjustment range of 80 mm. This is to accommodate chairs with bulky upholstery.

Part II. Test Conducted:

EN 1335-2: 2018 excluding information for use

No. of Sample:

1 piece (Sample 1). For more sample information and pictures, please refer to the following page.

Test and Requirements	Test Results				
4 Safety requirements					
4.1 General					
The chair shall be so designed as to minimise the risk of injury to the user.					
All parts of the chair with which the user comes into contact during intended use, shall					
be so designed that physical injury and damage to property are avoided.					
These requirements are fulfilled when:					
a) the edges of the seat, back rest and arm rests which are in contact with the user					
when sitting in the chair are rounded with minimum 2 mm radius;					
b) the edges of handles are rounded or chamfered in the direction of the force	PASS				
applied;	1 455				
c) all other edges and corners are free from burrs and rounded or chamfered;					
d) the ends of accessible hollow components are closed or capped.					
Movable and adjustable parts shall be designed so that injuries and inadvertent					
operation are avoided.					
It shall be possible to operate the adjusting devices from sitting position in the chair.					
It shall not be possible for any load bearing part of the chair to come loose					
unintentionally.					
4.2 Shear and squeeze points					
4.2.1 Shear and squeeze points under influence of powered mechanisms					
There shall be no accessible shear and squeeze points created by parts of the chair	PASS				
operated by powered mechanisms, i.e. springs, gas lifts and motorized systems.					
4.2.2 Shear and squeeze points during use					
There shall be no accessible shear and squeeze points created by loads applied during					
normal use.	PASS				
Shear and squeeze points are not acceptable if there is a risk of injury created by the					
weight of the user during normal movements and actions, e.g. manipulating levers and					
crank handles.					
4.3 Sequence of testing					
All applicable tests shall be carried out on the same sample.					
The chair shall be tested for stability according to EN 1022:2018, 7.3 and in the order of					
The chair shall be tested for strength and durability according to EN 1728:2012, Clause 7	r and in the order of				
Table 2.					
With the exception of the armrest downward static load test – central test, which shall be					
after the stability test according to Table 1, the chair shall be tested for stability after the stability	strength and durability				
tests according to Table 2.					

4.4 Stability tests and requirements

When tested according to Table 1, the seating shall not overturn.

Test and Requirements	Test Results
 EN 1022: 2018, 7.3.4 Sideways overbalancing, all seating without arms This test is applicable to all seating where the top edge of the seat on the transverse plane is 50 mm or less above the height of the loaded seat loading point. The transverse plane shall pass through the seat loading point. Position the seating on the floor surface with two adjacent supporting points on one side, or base restrained by stops. Apply a force of 600 N vertically by means of the loading pad at a point 60 mm behind the edge of the load bearing structure on the side nearest the stopped feet and on the transverse plane of the seat. In the transverse plane, apply a sideways force of 20 N horizontally outwards along a line from the point where the base of the loading pad meets the upper surface of the seat. 	N/A
 EN 1022: 2018, 7.3.5 Sideways overturning, all other seating 7.3.5.1 General This test is applicable to all seating with arms, or where the top edge of the seat on the transverse plane is more than 50 mm above the height of the seat loading point (A). 7.3.5.2 Seating with arm rests Position the seating on the floor surface with two adjacent supporting points on one side, or base restrained by stops. Apply a force of 250 N vertically by means of any suitable device, at a point 100 mm to the side of the fore and aft centre line of the seat which is nearest the stopped feet and on the transverse plane. Apply a force of 350 N vertically by any suitable device, at a position on the centre line of the arm up to a maximum 40 mm inwards from the outside edge of the arm structure at the intersection of the arm rest and the transverse plane, but not less than 40 mm from the front or rear edge of the arm structure. If the transverse plane does not intersect with the arm rest, apply the force of 350 N 40 mm from the point at the front or rear of the arm rest structure that is nearest the transverse plane. Apply a horizontal force of 20 N outwards, and perpendicular to the line joining the stopped feet, for at least 5s, at the upper surface of the seat or arm rest in line with the vertical force of 350 N and on the side with stopped feet. 	PASS

Page 7 of 12

Test and Requirements	Test Results			
EN 1022: 2018, 7.3.6 Rearwards overturning all seating with back rests				
The test is not applicable to seating that has adjustable back rest inclination that				
cannot be locked in position.				
For seating that has an adjustable back rest inclination that can be locked in position, it				
shall be locked in the most upright position. When an independent lumbar adjustment				
is fitted it shall be set in the most adverse configuration. Position the seating on the floor surface with the rear legs, two adjacent supporting				
points on the back, or base restrained by stops.				
Apply a vertical force of 600N to the seat by means of the loading pad at the seat				
loading point (A).	PASS			
Apply the force F ₂ horizontally in a rearward direction to the back of the seating at the				
back loading point, B, or at the top edge of the back rest, whichever is the lower.				
When the seating has more than one sitting place, carry out the procedure on two most				
adverse sitting places simultaneously.				
If the back rest pad is pivoting around a horizontal axis above the height of the seat				
and is free to move, the horizontal force shall be applied on the axis. If the back rest is				
height adjustable, the axis shall be set as close as possible to 300 mm above the seat				
loading point (A). EN 1022: 2018, 7.4.2 Tilting chairs				
The test method applies to all values of $\theta \ge 10^\circ$ and values of γ between 90° and 170°.				
If the seating has a locking system it shall be disabled.				
Load the seat with the 13 loading discs so that the discs are firmly settled against the	PASS			
back rest. If the height of the stack of discs exceeds the height of the back rest, or if				
support is needed, prevent the discs from sliding off by the use of the support.				
4.5 Structural safety requirements				
The structural safety requirements are met when the requirements according to 5.2 are	fulfilled.			
5.2 Requirements				
The strength and durability requirements are fulfilled when, after testing in accordance v	with Table 2:			
a) there are no fractures of any member, joint or component;				
 b) there is no loosening of joints intended to be rigid; and c) the chair fulfils its functions after removal of the test loads. 				
EN 1728: 2012, 7.3 Combined seat and back static load test				
Prevent the chair from moving rearwards by placing stops behind two adjacent				
supporting points at the rear of the chair.				
Chairs with a locking device(s) for seat and/or back rest angle movements shall be				
tested first with the device(s) locked for half of the cycles and then with the device(s)				
unlocked for the other half of the cycles. For the first half of the cycles the back rest	PASS			
shall be in the upright position.	1766			
Apply a vertical force of 1600 N through the seat loading pad at point A. Keep the seat				
loaded and apply a force of 560 N through the centre of the back loading pad at point				
B. When fully loaded the force shall act at $(90 \pm 10)^\circ$ to the back rest plane. If the chair tends to overturn, reduce the back rest force and report the actual force. Remove the				
back force and then the seat force. Repeat the test for 10 cycles.				
EN 1728: 2012, 7.4 Seat front edge static load test				
Position the smaller seat loading pad at loading point F or J. Apply a vertical downward	PASS			
force of 1600 N for 10 cycles through the centre of the loading pad.

Test and Requirements	Test Results
EN 1728: 2012, 7.6 Arm rest downward static load test – front The arm rests shall be loaded vertically with 450 N by means of the local loading pads for 5 cycles. The loading points shall be 75 mm from the front edge and centred side to side. Apply the force to both arm rests simultaneously.	PASS
EN 1728: 2012, 7.7 Arm rest sideways static load test For seating with one arm rest, apply an outward force of 400 N to the arm rest at the point along the arm rest most likely to cause failure, but not less than 100 mm from the end of the arm rest structure. Apply the force for 10 cycles using the local loading pad . If the item tends to overturn, apply a load on the side of the seat opposite to the arm rest under test large enough to prevent the item from overturning. For seating with two arm rests, apply an outward force of 400 N to each arm rest of the unit simultaneously at the point along the arm rests most likely to cause failure, but not less than 100 mm from either end of the arm rest structure, (see Figure 13). Apply the force for 10 cycles using the local loading pad. For seating with three or more arm rests, carry out the test on one pair of adjacent arm rests. All different arm rest designs shall be tested.	PASS
EN 1728: 2012, 7.11 Swivel test The base of the chair shall be secured on a rotating table with a test surface so that the rotating axis of the chair coincides with the rotating axis of the table. The upper part of the chair shall be loosely fixed in such a way as not to hinder the rotation of the base. Load the seat in loading point A with 60 kg and in loading point C with 35 kg, or any equivalent loading which will result in the same downwards force and bending moment on the chair. The angle of rotation shall be 360° at a rate of (10 ± 5) cycles/minute. Change direction after each rotation. Repeat the test for 120000 cycles.	PASS
EN 1728: 2012, 7.12 Foot rest durability Apply the specified downward force to the seat at the seat loading point. Apply a vertical force of 900 N by means of the local loading pad acting 80 mm from front edge of the load bearing structure of the foot rest at those points most likely to cause failure. For round cross section ring shaped footrests, the force shall be applied through the centre of the ring cross section. If the seating tends to overturn, increase the load on seat to a magnitude that just prevents overturning and record the load used. Repeat the test for 50000 cycles.	N/A

Test and Requirements	Test Results
EN 1728: 2012, 7.13 Castor and chair base durability This test does not apply to chairs with castors which are braked when the chair is loaded. The chair shall be placed on a rotating table with a test surface so that the rotating axis of the chair coincides with the rotating axis of the table. Load the seat at point A with the load of 110 kg. The base shall be loosely fixed in such a way that there is no rotation of the base but that the natural movements of the castors during testing are not prevented. The castors shall be left free to swivel and the table shall be rotated with a rate of six cycles per minute. The angle of rotation shall be from 0° to 180° and back. One rotation forward and one rotation backward constitutes one cycle. Alternatively attach the chair to a device that provides a linear movement of (1 000 \pm 250) mm and a test surface. Load the seat at point A with the load of 110 kg. The base shall be loosely fixed in such a way that there is no rotation of the base but that the chair to a device that provides a linear movement of (1 000 \pm 250) mm and a test surface. Load the seat at point A with the load of 110 kg. The base shall be loosely fixed in such a way that there is no rotation of the base but that the natural movements of the castors during testing are not prevented. The castors shall be left free to swivel and the device shall move with a rate of six cycles per minute. One movement forward and one movement backward constitutes one cycle. For both alternatives it is recommended to perform the test with a speed as slow as possible with a short break when the device changes direction. Repeat the test for 36000 cycles.	PASS
